

New, smart heavy goods machine from AGAB!

AGAB has the solution for transporting heavy loads in tight spaces! There are major problems with handling heavy loads in a safe and ergonomic way. We often work with large diesel trucks, traverses and with muscle power. To facilitate and do this with precision, AGAB has now developed a completely new product series that is adapted for loads up to 100 tonnes. AGAB's brand names on these are E10F - E100F and stand for Electric 10-100 ton front loaded heavy goods machine for up to 100 tons. The machine is compact and completely battery-powered and thus does not need diesel or LPG, which often has problems with CO₂ and odor. AGAB E10F-E100F handles heavy loads with integrated hydraulic ingenious lifting mechanism up and down. The E10F machine has recently been delivered to a truck company where heavy castings are transported and is also prepared for the customer's weights that are on special racks. The machine E10F is in its standard version equipped with a protected comfort zone where the operator is safe to operate the heavy goods machine.

The E10F is equipped with a powerful chassis and drive unit with programmable speeds. The actual lifting movement takes place via compact cylinders and controls in a robust design. The E10F machine is supplied via a 48V 420 Ah battery with long durability. The mobile heavy goods machine is part of a series and extends up to the E100F with capacity for 100 tonnes of cargo.
